

## **Reflection Questions**

### **1. Which type of machine learning interests you most and why?**

Supervised learning interests me most because I can see how it could be useful in cybersecurity, especially for detecting phishing emails.

### **2. What was the most challenging part of the ML workflow for you?**

For me, it was understanding the evaluation results. Running the code was straightforward, but explaining the model's mistakes took more thought.

### **3. How might you apply these concepts to a problem in your field of interest?**

I could use labeled emails to train a phishing detection model. Then I would test it on new emails and check which threats it missed or which legitimate emails it flagged.

### **4. What questions do you have about machine learning that you would like to explore further?**

I would like to learn how to choose useful features, handle imbalanced datasets, and keep a model effective as new threats appear.
